From Fire Emblem Wiki On the other hand, depending on how much you can invest into the unit, there is a lot to be gained by waiting to use an enemy's advantage. The Grogat Knights can easily get out of the delay between the two units if your spacing is off. In that case, the enemy's advantage might actually end up being your gain, allowing you to land attacks on your front line before they are struck. These units have several weaknesses. Firstly, they are weak when paired with lightly-armoured units. Secondly, when paired with heavy-armoured units, the Fire Emblem Warriors usually gain more strength, as the heavily armoured unit is the primary target. Finally, because the unit is slow and can only move 4 spaces per turn, these units are not good at maintaining the spacing needed to exploit an enemy unit's advantage. With proper use of their range-restricting bonuses and the speed penalty, however, the Dragon Lancers make an excellent combination with the Archery Units. They can function as a powerful, free "support" unit that can move all over the battlefield, preventing the Archery Unit from being stranded. And when the Archery Unit lands an attack, they can rush in to engage in melee combat, doubling the enemy's attack strength at the cost of their own damage.

We propose to examine the interaction of the human major histocompatibility complex (MHC) antigen genes with disease. A new approach to the problem of linkage and association of MHC and disease is proposed. This is based on the genetic and statistical analysis of MHC allele frequencies in random families. Two series of such families will be studied, including a new series of families already being recruited. Allele frequency distributions in the three classes of MHC-linked loci (HLA-A, -B, and -C) will be compared for a number of categories of disease. In a second series of families, the HLA-B locus will be characterized in more detail by high resolution serotyping for HLABw52 and other polymorphic B-loci. A panel of inbred strains will be used to detect polymorphism in the HLA-B region of the genome. The polymorphism detected will then be characterized in the random families, in order to estimate the number and
